A close-up photograph of a stainless steel flange. The flange is circular and has two threaded holes, one at the top and one at the bottom. The surface of the flange is highly reflective and shows fine concentric lines, likely from a grinding process. The lighting is bright, creating strong highlights and shadows that emphasize the texture and geometry of the part.

# SERVING YOU

— SINCE 1950 —

In 1950, a legacy was born. With its origin as a small carbon steel repair shop contained to one garage, Brandywine Machine Company has grown with the industry into one of the most well known and trusted stainless steel service center and machining facilities in the United States. As the company expanded to accommodate the needs of its customers, each additional foundation was laid with the same principals of quality service, unsurpassed speed and a passion for being the best. This commitment has allowed us the privilege of continuing to serve many of our original customers still to this day. Today, Bramco maintains its strategic location in the Greater Philadelphia area with a continually increasing base of satisfied customers. Our friendly staff makes sure to maintain the same personal relationship with every customer regardless of our expansion.

At Bramco, we treat every customer like our only customer.
